

Transaction Service - Update and Verification Report

Project: toucan-springboot-starter | Verification date: 1 September 2026

Outcome

The application was rebuilt, tested, packaged, and exercised through a running local server. All automated tests passed and all checked HTTP endpoints returned their expected status codes. No new application errors were found during this verification.

What was updated

File and location	Update	Why
src/main/java/com/example/transactionstarter/transaction/ApiExceptionHandler.java Lines 3, 6, 22-32	Added handlers for ConstraintViolationException and HttpMessageNotReadableException . Both return the existing JSON error format with HTTP 400.	A path transaction ID containing a space previously raised an unhandled validation exception and returned HTTP 500. Invalid request bodies also needed a consistent response.
src/test/java/com/example/transactionstarter/transaction/TransactionControllerIntegrationTest.java Lines 58-63	Added rejectsInvalidTransactionIdInPath , asserting an HTTP 400 response and the validation message.	Prevents the original HTTP 500 defect from returning in a future change.

Commands and results

Check	Command / request	Result
Java runtime	java -version (with JAVA_HOME set to JDK 22)	Java 22.0.1 confirmed
Automated tests	.mvnw.cmd clean test	8 tests passed; 0 failures; 0 errors
Package	.mvnw.cmd package	Spring Boot JAR created successfully
Live server	java -jar target\transaction-starter-0.0.1-SNAPSHOT.jar --server.port=8081	Started successfully for local checks

Live endpoint verification

Endpoint scenario	Expected	Actual
Sample endpoint	200	200
Create, get, update, customer list	201, 200, 200, 200	201, 200, 200, 200
Duplicate ID, missing ID	409, 404	409, 404
Invalid path ID, invalid JSON currency	400, 400	400, 400

Environment note: Maven must use JDK 17 or later. This machine has JDK 22 installed; its default Java path points to an older Java 8 JRE, so JAVA_HOME must be set before running Maven in a new terminal.
